

ABSTRACT OF THE DISCLOSURE

1
2 An expandable fire-fighting fluid container is arranged for receiving a fire fighting fluid. The
3 container is comprised of end walls, a bottom between the end walls, and movable side walls
4 connected to the end walls and the bottom with expandable seals. Actuators are attached between
5 the side walls and the end walls. The actuators are powered by an engine attached to the
6 container. The side walls are retractable inward for reducing container width for traveling on
7 public roads, and expandable outward for increasing fluid capacity at a fire site. A pump is
8 attached to the container for pumping the fluid to douse a fire.
